

# SiteValidator™

Get control over the accessibility on your web site

# Involve the editors in your accessibility efforts and discover common errors.

Using SiteValidator you get full control over the accessibility of your web site. New pages are automatically verified against W3Cs validator and the web editorial staff can quickly capture the errors. In addition to that the editor gets instant confirmation that the page is correct once it is created.

## Two features in one

SiteValidator is fully integrated with EPiServer CMS and offers an endorsement for the individual editor as well as serving as an important source of information for those responsible for the web site. All new and modified pages are automatically checked every day and a report of possible errors is generated. Anyone reading the report in EPiServer can clearly see the errors that exist on each page.

### The report tool in SiteValidator monitors the 16 most commonly made mistakes, for example:

- That the forms created using the form building tool has been made correctly
- That the tables are created correctly and that they are not used for layout purposes
- That there is a main heading on every page
- That certain types of formatting has not been done in the free text editor. This can happen if the editor use copy and paste from Word or other program
- That all images have a valid alt-attribute

## Real time validator

In order to involve the editor and increase the interest in the accessibility work a real time validator is controlling a page when it is saved and published. The editor can instantly see if the page is approved or not.

## Use SiteValidator in the development process

Are you or are you planning to build a new web site? Use the 60 day free trial version of SiteValidator to ensure the deliveries from your supplier.

### Tests for developers

- That all pages on the web site are validated according to the definition of a specific document type
- That not the same link text are used for different different destinations
- That all the pages have a title
- That the character encoding is specified in a correct way
- That each page has a correct language code

### System Requirements

SiteValidator requires EPiServer CMS 5 or later and .Net Framework 2.0 or higher.
